MAJDA, Aleksander, MAJOREK, Eugenia, and KOTELBA-WITKOWSKA, Barbara, with the technical assistance of ZURZYNSKA, Danuta; Division of Blood Storage (Dzial Konserwacji Krwi) (Director: Dr. med. A. MAJDA) of the Hematology Institute (Instytut Hematologii) in Warsaw (Director: Docent Dr. A. TROJANOWSKI)

"Effect of Composition of Tubing and Containers on Quality of Blood for Storage."

Warsaw, Farmacja Polska, Vol 19, No 9, 10 May 63, pp 192-196.

Abstract: In view of the differences of opinions and findings regarding the superiority of collecting and storing blood in one-time silicated and plastic material over the standard rubber tubing and glass container, the authors conducted their own study, using 3 set-ups: I -- rubber tubing--glass container, II -- rubber tubing--silicated container, and III -- plastic tubing--silicated container. They found little difference in the hematological quality of the blood, its preservability, or contamination transmissibility. There is no listing of references.

Application of float method to the determination of trace amounts of butanol in tributylphosphate. Wincenty Korpak and Kazimierz Majchrzak (Inst. Nuclear Research, Warsaw). *Chem. Anal.* (Warsaw) 4, 671–6(1959)(English summary); Alcock, *et al.*, *C.A.* 50, 13587*d*; Christensen and Fulmer, *C.A.* 29, 4696[8]; Munch *C.A.* 20, 1742.—To 500 ml. distd. water add 100 ml. Bu_3PO_4 (I) soln., heat to boiling, and collect 100 ml. of distillate (rate of distn. of 25–30 drops/min.). Filter, put 10 ml. of the distillate into a tube contg. a float, degas, cool slowly, and det. the temp. of equil. The method was tested on standard BuOH solns. in I. The errors were within the range of −7.4 to −15.4% (av. −11.6%). This was caused by BuOH distribution between water and I. To minimize errors, the coeff. 1.12 was used; the mean errors were not more than ± 2.3%.

Vulcanized Natural Rubber

1953. **Preparing metal surfaces for coating with rubber.** N. MAURICE PLANER and J. KAUSCHKOV. *Physical Chemistry*, 1952, **31 (VIII)**, 81 3. Results of research performed at the Institut Chimique de Nancy to determine the best methods of brass plating and applying a rubber coating are given for steel and aluminium. An electrolyte containing [illegible] of K Cu(CN)$_2$ and 7.5g. Et Zn(CN)$_2$ per litre is used. The furnished brass of about 70% copper and about 30% zinc, the alkalinity of which was high, approaching the range 12 to 62 kg. per cm. The process for preparing steel and aluminium surfaces is given. A final note states that rubber adhesion was poor on surfaces with other metal coverings; on phosphatised surfaces it was 15 to 28 kg. per cm.

Matichrt Planeta N. **Brushes for Electrical Machines.**

Nezotki maszyn elektrycznych" Przegląd Elektrotechniczny No. 9 10 11, 1950, pp 466 471, 5 figs., 1 tab

The author deals with the selection of raw materials for the production of brush materials (carbon, graphite and compound metal and graphite brushes). He also deals with the influence of the individual components on the physical properties of the brushes and on their behaviour in use. He further describes the manufacturing process: preparation of raw materials, moulding, heat treatment and finish. Drawing attention to the shortcomings of the method used in the production of compound brushes, the author refers to experiments in producing such brushes by the galvanic method

MAJCHERCZYK, J.

Investigation of spasmolytic properties of hydrochlorides of *N*-(1-naphthylmethyl)phenethylamine and *N*-(piperonyl)-phenethylamine. J. Majcherczyk and J. Szymanska (Acad. Med., Warsaw). *Acta. Polon. Pharm.* 12, 97-104(1955) (English summary).—The pharmacol. investigation of hydrochlorides of *N*-(1-naphthylmethyl)phenethylamine (I) and *N*-(piperonyl)phenethylamine (II) showed: Spasmolytic activity of I and II, especially of II, in concn. 1:2500 on isolated bowel is equal to the action of papaverine. The action on plain muscles of bronchi, blood vessels, and uterus is insignificant. I and II are antagonistic to $BaCl_2$, which shows that they act directly on the tissue of muscle. I and II cause short decrease of blood pressure and slowing down of heartbeat. In doses over 1 mg./100 g. they excite the central nervous system. L.D.$_{50}$ of I equals 3.6 and of II 4.1 mg./100 g. I shows hemolysis in concn. over 1:30000. II has no hemolytic activity. I and II do not cause inflammation of mucous membrane of eye in 1% concn.

Title : Electronic Time Meter of the Summing Type

Orig Pub : Pomiary, automat., kontrola, 1958, 4, No 5-6, 205-209

Abstract : Description of a time meter, the action of which is based on counting the number of cycles of an auxiliary frequency-stabilized oscillation, passing through the instrument during the measured time interval. At a frequency of auxiliary oscillations of 1 mc, the instrument makes it possible to measure time intervals from 0.01 to 999.99 milli-seconds with an accoracy of 10^{-5} $\pm$ 0.01 milliseconds.

Title : X-Virus in Potato and the Y-Virus. Diagnostic Methods

Orig Pub: Roczn. nauk rolniczych, 1956, D77, 82 s., il.

Abstract: Results are reported of seven-year investigations in Poland of X and Y potato viruses. Data are cited on the irregular concentration of X- and Y-viruses in separate organs of the plant. The Y-virus switches to an open form when potatoes are raised in high mountain conditions in especially arid and sunny years. In view of the

TITLE: Effective thermal conductivity in a model of the earth's upper mantle

SOURCE: Acta geophysica polonica, v. 14, no. 3, 1966, 161-174

TOPIC TAGS: ~~thermal~~ heat conductivity, ~~earth~~ upper mantle, earth crust, upper mantle model, heat ~~transfer~~ diffusion

ABSTRACT: The case of stationary heat flow in a simple model of the earth's upper mantle is examined. The model is based on: 1) the generally accepted mantle density distribution, 2) the melting point variation in the mantle suggested by Uffen, 3) the results of recent laboratory investigations of natural radioactive elements in magmatic rocks and meteorites, and 4) the most recent values for the heat flow on the earth's surface. Following a discussion of the forms of energy transfer caused in solids by the temperature gradient, the results of calculations of the heat-flow distribution for four variants of the upper mantle model are presented. The results computations are then used to estimate the variation of
